Guys,

Its come to my attention in the last couple days that the ceres.dll branded adclient is unable to
run exes or cabs unless they start with ceres_* This is a carryover from the failsafe we built
into speer.dll and I really dont think we need it in ceres.dll.

What this means is that ceres.dll cannot run any of our normal daily maintenance such as randreco,
intlreco or any of our torpedos or fatfinger clients. So we cant install stubbies and we cant
shoot torpedos to anybody that has ceres.dll.   The only way to currently do this is to
maintain and QA an entirely different set of maintenance templates and torpedo logic for ceres,
and that is an insane amount of our limited QA resources going forward. and I know we will screw
things up maintaining 2 and 3 copies of everything.

It should be really simple for somebody on terry's team to take out this upgrade filter and for
us to jam out ceres.dll 0.12.4.70 to anybody running 0.12.4.69.   We do this kind of upgrade all
the time and it is nothing new.

If this cant be ready by monday, I recommend we make the database changes to immediately stop
sending out ceres and start sending out the pynix.dll unbranded adclient on our front door
distribution.   The branded adclients are helpless little babes with bullseyes on them.

Rod
